We will use:

- Deriv Analysis tool
- Deriv smart trader
- Candlesticks
- 1 indicator

Deriv Analysis Tool.

From the deriv analysis tool above, you can identify digits from 0-9

- Note that the percentage attached to each digit represents its appearance in the past 1000 ticks
- The red bar/ mark represents the number that has least appeared in the past said ticks
- The green bar represents the most appearing number in the past 1000 ticks.

Where are these digits generated from?

When a candlestick is forming, its ticking either upwards/ downwards generates a random digit between 0-9. These are the digits that we trade in binary digits.

We have two types of candle sticks:

- Bullish candlestick- Its opening is lower than its closing
- Bearish candlestick- Its closing is lower than its opening

In most cases red candlesticks are bearish while green candlesticks are bullish. Note that the colour does not matter.

Indicator (Donchian channels**)**

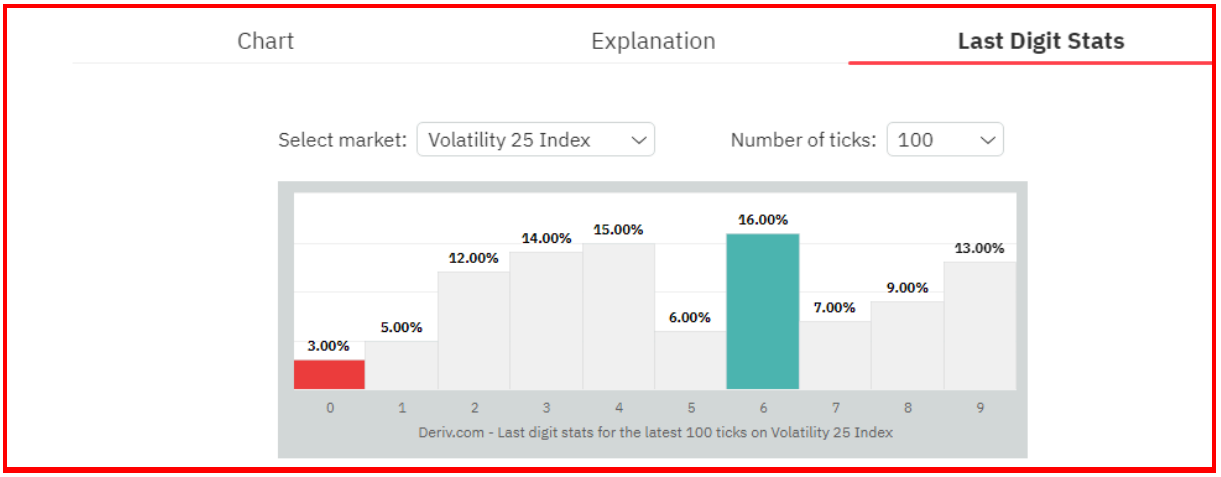

Donchian Channels is a technical indicator that seeks to identify bullish and bearish extremes that favour reversals, higher and lower breakouts, breakdowns, and other emerging trends.

In simple terms it helps us identify our key areas(where price is likely to reverse). This indicator has 3 lines;

- Upper resistance line
- Centerline
- Lower support line

Deriv Smart Trader

Conditions that should be met from the deriv analysis tool

- Most appearing digit (the one with the green bar) should be on any digit from 0 to digit 4
- The least appearing digit (the one with the red bar) should be on any digit from 0 to digit 6
- Green bar should be on the left of the red bar
- Three digits from 0 to 5 should be more than 10%

On the Candlesticks and indicator chart ensure;

- On the 15 and 5 minute time frame the candlestick forming is bearing.
- The candlestick forming is not on the key levels(on support or resistance level)

Deriv Smart Trader

- On the last 100 ticks ensure that the most appearing digits in terms of percentage distribution are under digits.
- Anytime digit 7,8,9 becomes the most appearing digit stop you're bot manually.
- Make sure the least appearing digit is not on digit 7,8,9

New updates done to the Bot

- There are a number of complex conditions that the bot checks. Its entry point is automated.
- It begins by purchasing under 9 for its very first contract
- It then changes to under 8
- Incase of a loss the bot then purchases under 7
- Remember this bot increases the stake amount on every run until it reaches a *1.5% of your capital
- Incase of a loss, it recovers by the next run. After recovery the martingale amount reduces as the bot continues to purchase contracts.

I recommend at least a $25 account for you to use this bot with confidence.

- Keep the bot's default settings.
- Change initial stake and win stake to your preferred amount.
- Set Martingel to 1.5
- To avoid over running your bot make sure you aim for an amount equivalent to twice your initial stake.

Risk Management

How do you manage your risk now that you have a working strategy?

`Expected profit per session should be 8-10% of your capital

Trade 3 sessions in a day

Stake should be as follows

Accounts below $20 stake 0.5

$20-$60 stake 1

$60- $100 stake 3

Above $100 stake 5
