We will use:

- Deriv Analysis Tool
- Chart
- ADX indicator

Chart and ADX indicator

Trending market- Is the one whose general direction is either upwards or downwards. When using this bot I recommend an uptrend.Use the 5 minutes time frame to do your analysis.
Remember we will be trading against the trend. Consider retracements.This is where we will take our trades from.

From the ADX

Ensure that;

- Green line is above the other two lines.
- Green line is losing momentum from the scale

Entry

- Candlestick forming should not be on momentum (Bearish Doji exhibits better results)
- Consider a bullish candlestick retesting or losing momentum that has just changed to a bearish candlestick.
- On the scale ensure that under 7 digits dominate

Deriv Analysis Tool

On the deriv analysis tool check and ensure that;

- Over 7 digits should have high appearance percentage digits. At Least 2 digits be over 10%
- Most appearing digit should be on one of the over 6 digits.
- Least appearing digit on the under 5 digits

How Does the Bot Execute

- My main focus when programming this bot was to secure your capital.
- This bot execute under 7 incase of a loss it then executes under 6 with the same amount(stake)
- Two consecutive losses attract a martingale of 1.5 your stake and the bot executes under 6. If you lose this trade, stop your bot manually. This means the market is now changing or is on momentum. In this senarial momentum is our enemy. We are trading against other traders who are trading over.
- If you stick to this advice strictly you cannot blow your account of at least 10 dollars staking 0.5

Risk Management

How do you manage your risk now that you have a working strategy?
Expected profit per session should be 8-10% of your capital

- Trade 3 sessions in a day
- Stake should be as follows
- Accounts below $20 stake 0.5
- $20-$60 stake 1
- $60- $100 stake 3
- Above $100 stake 5
